

Task comparison. Green: same protocol. Blue: our measurement, no matched published number. Amber: protocols differ, do not rank. Red: not done. No row claims a reconstruction-SOTA win.

Task	Metric	Closest published or baseline	This paper	How to read it
Reconstruction (EndoNeRF NVS)	held-out-view PSNR	EndoGaussian reports NVS PSNR (not re-run here)	not measured on this split	not comparable
Reconstruction (our canonical fit)	tissue-masked PSNR	no published number on this mask	36.79 / 34.09 dB pulling / cutting	reported only
SCARED portability	tissue-masked PSNR, single keyframe	no matched published number	26.99 / 26.17 dB kf1 / kf2	reported only
Tracking ablation	worst-frame loss, same sequence	inertia-only 37.23 (diverges)	const-vel + rollback 1.55	same protocol, better
Mask ablation	tissue-masked PSNR, same frames	tool-mask supervision 11.13 dB	depth>0 tissue mask 36.79 dB	same protocol, better
Uniform modulus	relative error, closed loop	no external method on this loop	0.01%	sanity check
FEM background E	median relative error	prior 60-scene line: 21.3% median	4.3% median (6 of 60 scenarios)	not the same set
Phantom contrast	error vs compression test	no published run on this phantom split	3.80x vs 3.56x (6.9%)	reported only
Provenance audit	measured / estimated / assumed	no prior method states this tag	explicit tag on every parameter	new statement, not a metric win
Official NVS SOTA and in-vivo absolute E	held-out PSNR; force-free E	EndoGaussian NVS; no force-free absolute E	not done	still open
